**# \* Acute Leukemia diagnostic Panel**

Sample: B.Marrow Heparinized

**Clinical Diagnosis:** Acute leukemia

**Impression:** Acute Lymphocytic Leukaemia - T cell type

**Immunophenotyping findings:** Immunophenotyping shows abnormal immature T cells in the marrow (44 % of the total white cells). The blasts are positive for CyCD3, negative for sCD3, have abnormal expression of CD7 (increased), CD5( increased), CD4 and CD8 negative, CD45( decreased), CD10( increased), with CD1a positive and normal expression of CD2, CD38 without CD34, CD13, CD16, CD19, CD20, CD33, CD56, CD64, CD117, HLA-DR, Cy 79a and Cy MPO. The presence of greater than 20% abnormal immature T cells in the peripheral blood and/or marrow (% of the total white cells) is diagnostic for precursor T-cell lymphoblastic lymphoma/leukemia (ALL) by WHO criteria.

Cytogenetic evaluation is recommended to provide additional prognostic information, and morphologic correlation is suggested.

**Comment:** The samples was run on BC Navios 10 color flow cytometer as per the standardized international protocol. FSC vs SSC was used to gate viable cells. CD45vs SSC gating strategy is used. Software used for analysis is woodlist version 3.1.3 and Kaluza 2.1.3

Note: Investigation should be interpreted understanding the limitation of the sample quality and various statistical parameters. An isolated laboratory report never forms a basis of any treatment decision. It should always be interpreted with the clinical course by the primary physician.

**Result/s to follow: Karyotyping**

\* **Marked tests are processed in our companion laboratories**
