HAEMATOLOGY**# Leukemia Lymphoma Comprehensive
Diagnosis Panel***Sample: Whole Blood EDTA***Impression:** Chronic Lymphocytic Leukaemia/Lymphoma

Immunophenotyping findings: The immunophenotypic identification of an abnormal B cell population having abnormal expression of CD5, CD20 (low), CD23, CD200 and lambda surface light chain restriction (decreased) with normal expression of CD19 and CD45 without CD10 and FMC7 could represent chronic lymphocytic leukemia / small lymphocytic lymphoma (CLL/SLL). However, small clonal CD5+ B cell populations may be seen in up to 3.5% of normal adults, and a definitive diagnosis of CLL/SLL will require clinical correlation. 0 % of the abnormal population expresses CD38, but the clinical significance of this values in this setting is uncertain. The abnormal B cell population comprises 85.4 % of the white cells following erythrocyte lysis.

Clinical and morphologic correlation is recommended.

Comment: The samples was run on BC Navios 10 color flow cytometer as per the standardized international protocol.

FSC vs SSC was used to gate viable cells. CD45vs SSC gating strategy is used.

Software used for analysis is woodlist version 3.1.3 and Kaluza 2.1.3

Note: Investigation should be interpreted understanding the limitation of the sample quality and various statistical parameters. An isolated laboratory report never forms a basis of any treatment decision. It should always be interpreted with the clinical course by the primary physician.**** End of Report******Dr Monica Singh**
